

RPG / RPW

Welding machine manufacturer Venvulas (Röwac) has developed a new stand alone Push-pull system for mig welding machines. This system can be used immediately on 95% of the mig welding machines which use a torch with Euro connection. It is a torch with power supply / control which does not require the installation of components in the welding machine. The unique thing about this system is that the handle of the torch where the motor is installed is not much larger than that of a normal handle without motor. Although the engine weighs 800 grams, its weight is compensated by the benefits which can be achieved by the system. These advantages include increasing the reach of the welder without wire cases or other wire transport systems, and by reconstructing the handle we have also been able to achieve a user-friendly gain, which in turn results in ease of use for the welder. The system as a whole is a Venvulas development, a lot of attention has been paid to the wire feed and the adjustment of the pressure on the counter pressure wheel, which means that the wire feed in the package is greatly improved. Through the choice of material and fabrication of the components, the entire combination of torch, package and power supply / control is an improvement on earlier systems.

The package can be supplied in water or gas-cooled version RPW (water) RPG (gas). The length of the package is 4 meters or 8 meters. Deviating sizes are produced optionally.

Prior Welding

* push pull torch

*normal torch
